OSNOVA / Mathematics practice

Linear equation: a worked example

Problem: 3(2x - 1) = 4x + 7

1. Expand: 6x - 3 = 4x + 7

2. Subtract 4x and add 3: 2x = 10

3. Divide by 2: x = 5

Check: both sides equal 27.

Common mistake: 3(2x - 1) is 6x - 3, not 6x - 1.

Theory: distributive law and equivalent equations.
